

PSD for Web Design

Name _____

1. what is a breakpoint?

Breakpoints are the point at which your site's content will respond to provide the user with the best possible layout to consume the information.

A CSS media query is used to define a breakpoint at various browser widths.

2. how are layers organized in a web design composition?

In a PSD web design comp, layers are **grouped into folders**, which are renamed based on their section. Folders should be organized from top to bottom based on where that content appears in the comp (the header folder is usually on top and the footer folder is always at the bottom).

3. what does the mobile-first approach mean in web design?

A mobile first approach means that basic styles are **served to mobile devices by default**, then gradually adjusted for wider screens using media queries.

The mobile first approach means prioritizing mobile content and building this first; it is the best approach for responsive designs.

4. what is the **a** in **rgba**? what does it do?

The **a** in rgba stands for **alpha**.

The alpha value controls the transparency or opacity of a color, and is measured in values from 0 to 1.

5. what underlying structural system is used to create web designs?

In web *design*, the underlying structural system is the **grid system**.
